*Topic: Education*

*Keywords: Digital education, Europe, Erasmus+, Digital technologies*

With the survey carried out on digital education in European schools we want to highlight its importance. The education systems of the 38 countries participating in the Erasmus+ program are analyzed. The research was conducted taking into consideration the primary and secondary school education systems (lower and upper) in the school year 2018/2019.

Digital technologies have revolutionized our society, in fact we speak of "digital natives", the children of "today" grow up and live with a "massive" use of these technologies.

The analysis of the surveys shows that the use of digital technologies is largely limited to leisure activities and not to school activities, highlighting a delay in the use of digital technologies in European schools. The development of digital skills is foreseen in almost all school curricula of the European countries.
